# Using Low Power Schottky (74LS) Logic for the EDUC-8 Microcomputer 

by
Steven S. Pietrobon, Ph.D.
29 March 2023.

## Abstract

The original Electronics Australia EDUC-8 microcomputer from 1974 was designed using standard 74 series TTL logic. This article describes the changes that are needed when using 74LS series logic, which uses $80 \%$ less power, has twice the loading capability and is about $85 \%$ faster.

## Introduction

The main changes that are required when using 74LS series logic are the pullup resistor values used on open collector (OC) outputs, mostly due to the lower $\mathrm{I}_{\mathrm{OL}}$ (output low current), $\mathrm{I}_{\mathrm{IL}}$ (input low current) and $\mathrm{I}_{\mathrm{IH}}$ (input high current) values. Typically, the resistor values for 74LS are about twice that for standard 74 series TTL. For inputs that are tied high via a resistor, these should be connected directly to $\mathrm{V}_{\mathrm{CC}}$ for 74LS, since they have diode inputs. However, some Fairchild 74LS logic uses the standard emitter type input (typically gates with open collector outputs, some flipflops and the clock inputs of ripple counters). These inputs will need to use a resistor.

## Summary of recommended changes

To reduce power consumption and meet loading requirements, these resistor values can be used for 74 series TTL. The values for 74LS must always be used. A detailed explanation for the changes is given in the following sections.

| E8/F | Rowe | 74/96L | 74LS/96LS |
| :---: | :---: | :---: | :---: |
| SR0-SR7 | 10K | 10K | 10K |
| SR0-SR7 | 10K | 3.3K | 5.6K (with EDUC-8ME) |
| SR0-SR7 | 10K | 1.5K | 3.3 K (with EDUC-8ME, paper tape reader and boot ROM)* |
| LA $2 \mathrm{R}_{\mathrm{x} 1}$ | 10K | 16K | 9.1K (For 96L02 and 96LS02) |

## Front Panel SR Pullup Resistor Values

The maximum resistor value is

$$
\begin{equation*}
R_{\max }=\frac{V_{\mathrm{CC}, \min }-V_{\mathrm{OH}}}{0.04 U_{\mathrm{IH}}} \tag{1}
\end{equation*}
$$

where for 74 series TTL we have
$V_{\mathrm{CC}, \text { min }}=$ minimum power supply voltage ( 4.75 V )
$V_{\mathrm{OH}}=$ output high voltage level ( 2.4 V for $74,2.7 \mathrm{~V}$ for 74 LS )
$U_{\mathrm{IH}}=$ summation of input high unit loads being driven (typically 1 for 74 and 0.5 for 74LS)
Each SR switch drives one input. This gives $R_{\max }=58.75 / 1=58.75 \mathrm{k} \Omega$. EDUC -8 uses $10 \mathrm{k} \Omega$, which
is OK. For 74LS we have $R_{\max } 51.25 / 0.5=102.5 \mathrm{k} \Omega$. So using 10 K pullups is fine with 7400 or 74LS.

However, the situation changes with EDUC-8ME. In this case, there are up to eight additional inputs to the E8M/D decoder, one for each EDUC-8ME. This gives $R_{\max }=58.75 / 9=6.528 \mathrm{k} \Omega$ for 74 and $102.5 / 9=11.389 \mathrm{k} \Omega$ for 74 LS . Since switches are used to drive the signal we let the average resistance $R_{\mathrm{av}}=R_{\max } / 2=3.264 \mathrm{k} \Omega$ for 74 and $5.694 \mathrm{k} \Omega$ for 74 LS . This implies the input voltage will be halfway between $V_{\mathrm{CC}}$ and $V_{\mathrm{OH}}$. Choosing the closest recommended values gives 3.3 K for 74 and 5.6 K for 74 LS .

Note that if a boot ROM and paper tape reader are used, we can have up nine inputs and two OC outputs. We have

$$
\begin{equation*}
R_{\min }=\frac{V_{\mathrm{CC}, \max }-V_{\mathrm{OL}}}{I_{\mathrm{OL}}-1.6 U_{\mathrm{IL}}} \quad R_{\max }=\frac{V_{\mathrm{CC}, \min }-V_{\mathrm{OH}}}{N_{\mathrm{O}} I_{\mathrm{OH}}+0.04 U_{\mathrm{IH}}} \tag{2}
\end{equation*}
$$

where
$V_{\mathrm{CC}, \text { max }}=$ maximum power supply voltage ( 5.25 V )
$V_{\text {OL }}=$ output low voltage level ( 0.4 V for $74,0.5 \mathrm{~V}$ for 74 LS )
$I_{\mathrm{OL}}=$ output low open collector current ( 16 mA for $7401,8 \mathrm{~mA}$ for 74 LS 01 )
$I_{\mathrm{OH}}=$ output high open collector current $(0.25 \mathrm{~mA}$ for $7401,0.1 \mathrm{~mA}$ for 74LS01)
$U_{\mathrm{IL}}=$ summation of input low unit loads being driven (typically 1 for 74 and 0.25 for 74LS)
$N_{\mathrm{O}}=$ number of open collector outputs connected together
We thus have for 74 series TTL

$$
\begin{equation*}
R_{\min }=\frac{4.85}{16-1.6 N_{\mathrm{IL}}} \quad \quad R_{\max }=\frac{2.35}{0.25 N_{\mathrm{O}}+0.04 N_{\mathrm{IH}}} \tag{3}
\end{equation*}
$$

where $N_{\mathrm{IL}}$ and $N_{\mathrm{IH}}$ is the number of standard 1.6 mA input low and 0.04 mA input high units, respectively. For 74LS series TTL we have

$$
\begin{equation*}
R_{\mathrm{LS}, \min }=\frac{4.75}{8-0.4 N_{\mathrm{IL}}} \quad R_{\mathrm{LS}, \max }=\frac{2.05}{0.1 N_{\mathrm{O}}+0.02 N_{\mathrm{IH}}} \tag{4}
\end{equation*}
$$

where $N_{\mathrm{IL}}$ and $N_{\mathrm{IH}}$ is the number of standard $1.6 \times 0.25=0.4 \mathrm{~mA}$ input low and $0.04 \times 0.5=0.02 \mathrm{~mA}$ input high units, respectively.

In this case, we have $N_{\mathrm{I}}=9$ and $N_{\mathrm{O}}=2$ which gives $R_{\min }=3031 \Omega$ and $R_{\max }=2733 \Omega$, implying that the circuit won't work with any pullup value. This can be be fixed by using a 7438 2-input NAND OC buffer with $U_{\mathrm{OL}}=30$. This gives $R_{\min }=144 \Omega, R_{\max }=2733 \Omega, R_{\mathrm{av}}=1438 \Omega$ and $R_{\mathrm{rec}}$ $=1.5 \mathrm{~K}$. For 74LS01 we have $R_{\min }=1080 \Omega, R_{\max }=5395 \Omega, R_{\mathrm{av}}=3237 \Omega$ and $R_{\mathrm{rec}}=3.3 \mathrm{~K}$.

## Front Panel LED Resistors

The 5 mm Z0800 Red LEDs from Altronics have a forward current of 15 mA and forward voltage of 2.3 V . The pullup resistor is $180 \Omega$. Using the $I_{f}$ versus $V_{f}$ graph from the LED data sheet [1], $V_{\mathrm{OL}}=0.4 \mathrm{~V}, V_{\mathrm{CC}}=5.25 \mathrm{~V}$ and $R=171 \Omega(-5 \%)$, this gives $I_{f}=15.8 \mathrm{~mA}$. As $I_{\mathrm{OL}}=10 U_{\mathrm{OL}}$ $=16 \mathrm{~mA}$, this is just within specification for the 7405 OC inverters. The 7417 OC buffers have the same specification.

As the 74LS05 [2] has a standard output of only $I_{\mathrm{OL}}=5 U_{\mathrm{OL}}=8 \mathrm{~mA}$, this means a higher resistor value will be needed. With 74LS05 we have $V_{\mathrm{OL}}=0.5 \mathrm{~V}$. At $I_{f}=8 \mathrm{~mA}$, this gives $\mathrm{V}_{f}=2.03 \mathrm{~V}$ and $R_{\min }=(5.25-0.5-2.03) / 0.008=340 \Omega$. Thus, you will need to use a $390 \Omega$ resistor, but the LEDs are at 2.7 mcd , compared to 5 mcd with 7400 .

However, the 74LS06/74LS16 OC inverters [3] and 74LS07/74LS17 OC buffers [4] all have $I_{\mathrm{OL}}=16 \mathrm{~mA}$ at $V_{\mathrm{OL}}=0.4 \mathrm{~V}$. This means you will need to replace the 7405 either with a 74 LS 06 or 74LS16 and the 7417 either with a 74LS07 or 74LS17.

## Front Panel 9602

The front panel uses a 9602 dual multivibrator. For signal LA2 $\mathrm{R}_{\mathrm{x} 1}=10 \mathrm{~K}$ and $\mathrm{C}_{\mathrm{x} 1}=100 \mathrm{pF}$ gives a pulse width of $t_{\mathrm{w} 1}=0.46 \mu \mathrm{~s}$. For the 96L02 the graph from the data sheet gives $\mathrm{R}_{\mathrm{x} 1}=20 \mathrm{~K}$
and $\mathrm{C}_{\mathrm{x} 1}=45 \mathrm{pF}$. This has a time constant of $T_{1}=\mathrm{R}_{\mathrm{x} 1} \mathrm{C}_{\mathrm{x} 1}=0.9 \mu \mathrm{~s}$. By choosing standard component values of $\mathrm{R}_{\mathrm{x} 1}=16 \mathrm{~K}$ and $\mathrm{C}_{\mathrm{x} 1}=56 \mathrm{pF}$, we have $\mathrm{R}_{\mathrm{x} 1} \mathrm{C}_{\mathrm{x} 1}=0.896 \mu \mathrm{~s}$, close to the desired value. The table below shows how the other values were calculated.

| Rowe (9602) |  |  | Device | Graph |  |  | Recommended |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \boldsymbol{\Omega})$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ | $t_{\mathrm{w}}(\mu \mathrm{s})$ |  | $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \boldsymbol{\Omega})$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ | $T(\mu \mathrm{~s})$ | $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \boldsymbol{\Omega})$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ | $T(\mu \mathrm{~s})$ |
| 10 | 100 | 0.46 | L02-1 | 20 | 45 | 0.90 | 16 | 56 | 0.896 |
|  |  |  | LS02-1 | 10 | 92 | 0.92 | 9.1 | 100 | 0.910 |
| 10 | 1000 | 3.3 | L02-2 | 20 | 430 | 8.60 | 18 | 470 | 8.460 |
|  |  |  | LS02-2 | 10 | 750 | 7.50 | 16 | 470 | 7.520 |

## Bus Pullups

Examining the schematics, the busses have the following UL for 74 . The 7480 has an unusual $0.4 U_{\mathrm{IH}}$. For $74 \mathrm{LS}, U_{\mathrm{IH}}$ is multiplied by 0.5 and $U_{\mathrm{IL}}$ by 0.25 , except for the 7480 inputs in E8/P, since the 74LS80 is not available (a Texas Instruments 74LS80 is shown on eBay from China, but this is likely a fake part). For the D-bus, we use $V_{\mathrm{OL}}=0.45 \mathrm{~V}, I_{\mathrm{OH}}=0.1 \mathrm{~mA}$ and $U_{\mathrm{OL}}=10$ for the 93415/D2115 static RAM OC outputs.

| Board | $\mathrm{A}-\mathrm{BUS}$ |  |  |  | B-BUS |  |  |  | C-BUS |  |  | D-BUS |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $N_{\mathrm{O}}$ | $U_{\mathrm{IH}}$ | $U_{\mathrm{IL}}$ | $N_{\mathrm{O}}$ | $U_{\mathrm{IH}}$ | $U_{\mathrm{IL}}$ | $N_{\mathrm{O}}$ | $U_{\mathrm{IH}}$ | $U_{\mathrm{IL}}$ | $N_{\mathrm{O}}$ | $U_{\mathrm{IH}}$ | $U_{\mathrm{IL}}$ |  |  |
| E8/A | 1 | 1 | 1 | 3 | - | - | 1 | - | - | - | 1 | 1 |  |  |
| E8/P | 1 | 2 | 2 | 1 | 0.4 | 1 | 2 | 0.4 | 1 | - | - | - |  |  |
| E8/M | - | - | - | 1 | - | - | 3 | 2 | 2 | 2 | 2 | 2 |  |  |
| E8/IOT | 1 | - | - | - | - | - | - | - | - | - | - | - |  |  |
| Total 74 | 3 | 3 | 3 | 5 | 0.4 | 1 | 6 | 2.4 | 3 | 2 | 3 | 3 |  |  |
| Total LS | 3 | 1.5 | 0.75 | 5 | 0.4 | 1 | 6 | 1.4 | 1.5 | 2 | 1.5 | 0.75 |  |  |

The minimum, maximum, actual and recommended values for the pullup resistors that are on the E8/C board for 74 and 74LS are

|  | 74 series TTL |  |  |  |  | 74LS series TTL |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $R_{\text {rowe }}$ | $R_{\min }(\Omega)$ | $R_{\max }(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ | $R_{\min }(\Omega)$ | $R_{\max }(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ |
| A-BUS | 470 R | 433 | 2701 | 1567 | 1.5 K | 699 | 5694 | 3126 | 3.3 K |
| B-BUS | 470 R | 337 | 1856 | 1097 | 1.0 K | 742 | 3973 | 2358 | 2.2 K |
| C-BUS | 680 R | 433 | 1472 | 953 | 1.0 K | 848 | 3125 | 1987 | 1.8 K |
| D-BUS | 680 R | 429 | 7344 | 3886 | 3.9 K | 324 | 7885 | 4104 | 3.9 K |

We can see that for 74 series TTL, the original values are all within range, but are quite close to the minimum values. Higher values can be used, with a small reduction in power. For 74LS we can see that except for D-BUS, higher pullup values will need to be used. With EDUC-8ME, the A-bus has one extra driver from E8/B. The two RAMs for D-BUS are replaced by a single standard OC output from E8/B. For 7400 and 74LS we thus have

| Signal |  | 74 series TTL |  |  |  | 74LS series TTL |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $N_{\mathrm{O}}$ | $R_{\min }(\Omega)$ | $R_{\max }(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ | $R_{\min }(\Omega)$ | $R_{\max }(\Omega)$ | $R_{\mathrm{av}}(\Omega)$ | $R_{\mathrm{rec}}$ |
| A-BUS | 4 | 433 | 2098 | 1266 | 1.2 K | 699 | 4457 | 2578 | 2.7 K |
| D-BUS 7401 | 1 | 433 | 6351 | 3392 | 3.3 K | 699 | 12812 | 6756 | 6.8 K |
| D-BUS 93415 | 1 | 429 | 10682 | 5555 | 3.3 K | 324 | 12812 | 6568 | 6.8 K |

As we need to use one 93415 RAM to adjust the $\overline{\mathrm{WE}}$ width, we need to make sure the recommended value for the D-BUS will work. We can see that the 3.3 K value for 74 and 6.8 K for 74 LS are within the minimum and maximum resistor range and thus can be used with both the 7401 from E8/B or one 93415.

## E8/T Timing Board

Four 2.2K pullup resistors are used. Two 7420 dual 4-input NAND gates have one gate each (one for the clock and one for the master reset) with three inputs tied high. This gives $R_{\max }=58.75 / 3$ $=19.583 \mathrm{k} \Omega, R_{\mathrm{av}}=9.792 \mathrm{k} \Omega$ and $R_{\mathrm{rec}}=10 \mathrm{~K}$. The $9316 / 74161$ counter has two inputs tied high, but with three ULs, giving $R_{\text {rec }}=10 \mathrm{~K}$. Finally, the 7473 dual JK FF used for Execute and Defer Control has two inputs tied high. This gives $R_{\max }=58.75 / 2=29.375 \mathrm{k} \Omega$ and $R_{\mathrm{av}}=14.688 \mathrm{k} \Omega$. Since this exceeds the 10 K recommended maximum, we let $R_{\mathrm{rec}}=10 \mathrm{~K}$. Thus, all the 2.2 K pullups can be replaced with 10 K pullups. For 74LS, the pullups should be replaced with wired links.

## E8/D Decoder Board

Two 2.2 K pullup resistors are used. One resistor is used to tie one input of the $9334 / 74259$ decoder high. The other resistor ties one input of a 7400 quad 2-input NAND gate high. Thus, both these resistors can be replaced with 10 K pullups.

## E8/A Board

There are two spare 7401 quad 2-input NAND OC and one spare 7405 hex inverter OC gates with one output and one input. Two 7405 OC hex inverters are used with eight outputs tied together to generate the $\mathrm{AC}=0$ signal. This signal goes to one input on $\mathrm{E} 8 / \mathrm{P}$. This gives

| Signal | $N_{\mathrm{O}}$ | $N_{\text {I }}$ | $R_{\text {rowe }}$ | 74 series TTL |  |  |  | 74LS series TTL |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $R_{\text {min }}(\Omega)$ | $R_{\max }(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ |
| Misc | 1 | 1 | 2.2 K | 337 | 8103 | 4220 | 3.9K | 625 | 17083 | 8854 | 8.2K |
| AC=0 | 8 | 1 | 820R | 337 | 1152 | 744 | 680R | 625 | 2500 | 1562 | 1.5K |

Rowe uses 2.2 K for the miscellaneous pullups, which will work fine for both 7400 and 74LS. However, 3.9 K and 8.2 K for 74 and 74 LS , respectively, can also be used with a small reduction of power. For AC=0, Rowe used 820R for the pullup, which will also work with 74LS. A 680R resistor could be used for 74 , which is closer to $R_{\text {av }}$ than 820 R . For 74 LS , a 1.5 K pullup can be used if desired.

## E8/P Program Counter and Adder Board

Two 2.2 K pullup resistors are used. One resistor is used to tie two inputs of the 7480 adder high. The other resistor ties five inputs of the $9001 / 74105 \mathrm{JK}$ FF high. For the 7480 , each input has $U_{\mathrm{IH}}$ $=0.4$ for 0.8 UL total. Thus the pullup can be replaced with a 10 K resistor if desired. For the 9001, four inputs have 1.5 UL while one input has 3 UL. This gives $R_{\max }=58.75 /(4 \times 1.5+3)=58.75 / 9$ $=6.528 \mathrm{k} \Omega, R_{\mathrm{av}}=3.264 \mathrm{k} \Omega$ and $R_{\mathrm{rec}}=3.3 \mathrm{~K}$.

## E8/M Memory Board

Two 7405 OC hex inverters are also used on this board. Eight outputs are tied together to generate the $\mathrm{MB}=0$ signal. This signal goes to one input on E8/P. One OC inverter drives two inputs of the 7493 strobe counter. We have

| Signal | $N_{\mathrm{O}}$ | $N_{\text {I }}$ | $R_{\text {rowe }}$ | 74 series TTL |  |  |  | 74LS series TTL |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ |
| 7493 | 1 | 2 | 820R | 379 | 7121 | 3750 | 3.9K | 660 | 14643 | 7651 | 8.2 K |
| MB=0 | 8 | 1 | 820R | 337 | 1152 | 744 | 680R | 625 | 2500 | 1562 | 1.5K |

For the 7493 input, Rowe uses an 820R pullup which will also work with 74LS, although an 8.2 K pullup can also be used if desired.

Two of the OC inverters are used to drive the MA7 and PC7 LEDs on the front panel. As for the front panel, the second 7405 will need to be replaced with a 74LS06 or 74LS16 in order to have sufficient drive for the LEDs.

## Page Zero Modification

The page zero extension uses one of the 7405 OC inverters and a 7401 quad 2-input NAND OC. The inverter and one NAND have single outputs and inputs. We also have three outputs driving the the enable input of the 74157. The 74LS157 has a double load ( $U_{\mathrm{IH}}=1$ ) for the $\overline{\mathrm{E}}$ input. We have

| Signal | $N_{\mathrm{O}}$ | $\begin{gathered} N_{\mathrm{I}} \\ 74 / \mathrm{LS} \end{gathered}$ | $R_{\text {SSP }}$ | 74 series TTL |  |  |  | 74LS series TTL |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rect }}$ | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | fec |
| Misc | 1 | 1/1 | 820R | 337 | 8103 | 4220 | 3.9 K | 625 | 17083 | 8854 | 8.2K |
| 74157 | 3 | 1/2 | 820R | 337 | 2975 | 1656 | 1.8K | 660 | 6029 | 3345 | 3.3K |

To decrease the load on the P14 and MB3 signals and reduce power, the two inputs to each NAND gate can be changed to a single input, with the other input tied high. A 10 K pullup can be used for the two inputs tied high.

## E8/IOT Interface Board

Two 7401 OC quad NANDs are used, all using 1K pullups. We have four outputs driving two inputs, one output driving one input, one output driving two inputs, and output IOT_SKP_driving one input on E8/P. In summary

| $N_{\mathrm{O}}$ | $N_{\text {I }}$ | $R_{\text {rowe }}$ | 74 series TTL |  |  |  | 74LS series TTL |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ | $R_{\text {min }}(\Omega)$ | $R_{\text {max }}(\Omega)$ | $R_{\text {av }}(\Omega)$ | $R_{\text {rec }}$ |
| 4 | 2 | 1K | 379 | 2176 | 1277 | 1.2 K | 660 | 4659 | 2659 | 2.7 K |
| 1 | 2 | 1K | 379 | 7121 | 3750 | 3.9 K | 660 | 14643 | 7651 | 8.2K |
| 1 | 1 | 1K | 337 | 8103 | 4220 | 3.9K | 625 | 17083 | 8854 | 8.2K |

Thus, the 1 K pullups can be used as is or the above values above can be used.

## E8/KI Simple Input Keyboard

If driving LEDs, the 7405 needs to be replaced with either a 74LS06 or 74LS16. The 9602 dual multivibrator has one $\overline{\mathrm{I}_{0}}$ and the two $\overline{\mathrm{C}_{\mathrm{D}}}$ inputs tied high. This has $U_{\mathrm{IH}}=3 \times 1.5=4.5$ and thus $R_{\text {max }}$ $=58.75 / 4.5=13.056 \mathrm{k} \Omega, R_{\mathrm{av}}=6.528 \mathrm{k} \Omega$ and $R_{\mathrm{rec}}=6.8 \mathrm{~K}\left(10 \mathrm{~K}\right.$ for 96 L 02 as $\left.U_{\mathrm{IH}}=1.5\right)$. The table below gives the values for $\mathrm{R}_{\mathrm{x}}$ and $\mathrm{C}_{\mathrm{x}}$, where the formulas $t_{\mathrm{w}}=0.31 \mathrm{C}_{\mathrm{x}}\left(\mathrm{R}_{\mathrm{x}}+1\right), 0.33 \mathrm{C}_{\mathrm{x}}\left(\mathrm{R}_{\mathrm{x}}+3\right)$ and $0.43 \mathrm{C}_{\mathrm{x}} \mathrm{R}_{\mathrm{x}}$ for 9602, 96L02 and 96LS02, respectively, were used for the second multivibrator.

| Rowe (9602) |  |  |  | Graph/Formula |  |  | Recommended |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \Omega)$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ |  |  |  | $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \Omega)$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ | $T(\mu \mathrm{~s})$ | $\mathrm{R}_{\mathrm{x}}(\mathrm{k} \Omega)$ | $\mathrm{C}_{\mathrm{x}}(\mathrm{pF})$ |$\left.) T(\mu \mathrm{~s})\right)$.

## E8/S Octal Display

The 1713 dual 4-input NAND Schmitt trigger has three inputs tied high using a 1 K resistor. This can be replaced with a 10 K resistor if desired.
